Prunus mahaleb

The Mahaleb Cherry is mainly found in warm regions with wine-growing. Its numerous aromatic white flowers that show in April and May, provide a food source for bees, and the afterwards upcoming small stone fruits are very popular with birds. For humans, the bitter fruits are not good to eat. In the eastern Mediterranean region the ground kernels are sold as spice under the name Mahaleb. The summer-green small tree that grows only between two and six meters tall, exhumes through its young sprouts - due to its coumarin content - a pleasant scent.

Natural location: The natural habitat of the Mahaleb Cherry is in the northern Mediterranean region, particularly in Morocco, Spain and the South of France and stretches until Anatolia. It can also be found in warmer areas of the Kaiserstuhl and close to the river Nahe.

Cultivation: Seed propagation indoors is possible throughout the year. To increase the germinability, you should keep the seeds sealed in a plastic bag in the regular refrigerator for about a week. After that, plant the seeds about 1 cm deep into moist potting compost or sandy bonsai earth and cover the seed container with clear film to prevent the earth from drying out. Don't forget to make some holes in the clear film and take it every second or third day completely off for about 2 hours. That way you avoid mold formation on your potting compost. Place the seed container somewhere bright and warm with a temperature around 20° Celsius and keep the earth moist, but not wet. The germination takes about four to ten weeks.

Place: The Mahaleb Cherry prefers a very warm and full sunny place, and willingly even as a solitary plant in the blazing sun.

Care: Due to its origins, the Mahaleb Cherry can endure even longer dry periods - and - other than many other plants - it also tolerates calcareous, hard water. From April until September it should be given fluid fertilizer every four weeks. The plant can easily and even harshly be pruned back.

During the winter: The Mahaleb Cherry is fully frost-hard and doesn't need any special winter preparations - only in young plants it is recommended for the first two years, to earth up some foliage.
